-
- Remember, only one choice is truly correct or best.
 - Consider evidence-based guidelines and clinical reasoning.
-
- Beware of Distractors
-
- Distractors are plausible but incorrect options designed to challenge your knowledge.
 - Use your understanding of geriatric principles to identify distractors.
-
- Use Clinical Judgement and Evidence
-
- Think about the patient's overall context.
 - Base your choice on current best practice guidelines.

Example of a High-Yield Geriatric MCQ

Question:

An 82-year-old woman presents with a 2-week history of confusion, decreased oral intake, and urinary frequency. She has a history of hypertension, osteoarthritis, and mild cognitive impairment. On examination, she is febrile, tachycardic, and has suprapubic tenderness. Urinalysis shows nitrites and leukocytes. Which is the most appropriate initial management?

- A) Start empiric antibiotics for suspected urinary tract infection (UTI)
- B) Obtain a renal ultrasound before initiating treatment
- C) Observe and re-evaluate in 24 hours
- D) Prescribe antipyretics and monitor symptoms
- E) Admit for intravenous fluids and broad-spectrum antibiotics

Answer:

- A) Start empiric antibiotics for suspected urinary tract infection

Explanation:

This patient exhibits classic signs of a urinary tract infection with systemic features (confusion, fever, suprapubic tenderness, positive urinalysis). In older adults, UTIs can precipitate delirium, and prompt initiation of antibiotics is crucial. While further investigations like ultrasound may be indicated later, initial management should focus on treating the infection. The other options are less appropriate given the clinical picture.
